The Arizona Crisis in Physics Education:  
How Arizona Businesses Can Help  
July 2017

Students are being encouraged to pursue a STEM career path, but high school physics enrollment in Arizona is only half of the national average. This document explains why, without physics, an Arizona student’s success in post-high school STEM education is in jeopardy – and how Arizona businesses can improve the situation.

Why should more students take high school physics?

Physics, more than any other subject in high school, teaches quantitative and analytical reasoning skills. Math is an important tool, but physics makes math "make sense".

Physics is a gateway course for post-secondary study in science, medicine, and engineering, as well as an essential component in the formation of students’ scientific literacy. (Position Statement of the National Alliance of Black School Educators - 2012)

Most leakage from the STEM career "pipeline" occurs in high school and in the transition from high school to college, not in college. Most students who do not /cannot take high school physics never enter the STEM pipeline.

Students who take high school physics are twice as likely to be ready for any college science -- and for workforce training programs -- according to ACT research. Thus ACT recommends a high school core curriculum that includes physics. (ACT 2006, page 3. 45% are ready vs ~20%. http://files.eric.ed.gov/fulltext/ED493179.pdf; see also ACT 2013, page 8 at http://www.act.org/content/dam/act/unsecured/documents/Policy-Platforms-k-12-online.pdf)

Why aren’t more Arizona students taking physics?

Nationally the number of high school students taking physics has grown to 40%. Unfortunately Arizona has moved in the opposite direction. Physics enrollment is below 20% and not even offered in some large high schools because of a lack of qualified staff. High salaries offered by industry have created an environment in which universities graduate few physics majors who desire to teach.

Monica Plisch, Associate Director of Education and Diversity at the American Physical Society, said, "Physics is often seen as an elite discipline that requires a lot of math and is only for college-bound students. This view is not only outdated, it risks underestimating students' abilities and cutting off their future opportunities in STEM”.

Of all school subjects, physics has the most severe teacher shortage, followed by math and chemistry. Surpluses of biology teachers exist.

The shortage of physics teachers leaves many U.S. students unprepared for college study in STEM disciplines. America lags far behind most of our global competitors in
physics education. Large STEM-trained populations in China and India support burgeoning industrial development in those countries.

To better understand the crisis at school level, Earl Barrett and Larry Dukerich, with support of a grant from The Boeing Company in Mesa and assistance of the Arizona Department of Education, surveyed high school counselors in January 2017. Recognizing that they also needed data on students’ views, they gave a similar instrument in February to chemistry students in 8 Arizona school districts. They received responses from 75 counselors and nearly 900 students.

**Summary of Survey Results**

1. Only 45% of chemistry students surveyed said they have a good idea of what they would study in physics. Nearly 65% of counselors think that students DO NOT have a good grasp of what physics is about.

2. While 60% of students feel that they have the math skills needed to be successful in physics, almost 70% of counselors disagree with that view.

3. About 45% of students aren’t sure that physics would help them succeed in college or technical school. 57% of counselors think that students are not aware of benefits of physics.

4. Nearly 65% of students fear that a poor grade in physics will hurt their chances of being accepted by college. 56% of counselors agree.

5. More than 40% of students think that physics is only for people intending to become engineers. Over half of the counselors think this is what students believe.

6. It is distressing that nearly 60% of counselors admit that they have no significant contact with the physics teacher(s) at their school.

**Conclusions**

The majority of counselors believe, erroneously, that physics requires a student to have exceptional math skills and a desire to be an engineer. Without a belief that physics is important for anyone interested in a STEM career, they often steer students to other science courses.

**How can Arizona businesses address this crisis?**

You can do two things to make it likely that your company can hire adequately prepared employees in the future:

- As companies like Boeing has done in the past, your company can earmark monies to provide tuition support for teachers who are trying to become certified to teach physics.
- Send a clear message to our legislators and governor that you expect them to provide adequate support to schools and teachers, to ensure that students who wish to pursue a STEM career will have opportunity to take a quality high school physics course. They need to know that your company feels physics is vital for STEM careers.

Details: ASU is the birthplace of a world-renowned program in the reformed practice of teaching physics – Modeling Instruction. Each summer it offers workshops and content courses that empower teachers to re-train and earn certification as physics instructors. The recently signed Arizona Senate Bill 1038 (May 2017) helps to defray the cost of such coursework, with $2000 grants to teachers. This is only enough to pay for one 3-credit graduate course. This is simply insufficient incentive for teachers, whose salaries are typically under $40,000 and
who are paying off student debt. With additional funding from businesses, it is possible to re-
train a teacher for physics in as little as two summers and a school year of evening classes.

What can be done at school level to address this crisis?

• Most of our schools could add two or more sections of physics with their present staffing.
• School districts have the right to declare that physics has enough mathematics to meet the
  math requirement for graduation. We believe students would be eager to take a class
  where math is applied in real world contexts, as their 4th required math class.
• Our survey revealed that counselors overwhelmingly agree they would support physics
  for the average student if the class was designed to improve students’ math skills and was
  built around practical applications and a project-based design.
• Schools need to recognize that a vibrant physics program better prepares most students
  for STEM careers than do AP science courses. HVAC techs and plumbers use physics
daily. Physics should be taken by most students, whereas only a few benefit from AP
  sciences. The AP model does not work for most students.

We would be glad to provide our surveys. If you want to examine them closely, we can share
counselor comments and survey results by question. We would be pleased to meet with you to
answer your questions about implementing a plan to increase physics enrollment in high school.

Larry Dukerich  ldukerich@mac.com
Earl Barrett  ejbarrett10@gmail.com

Larry Dukerich received his B.S. in Chemistry from Michigan State University and his Master of Natural Science
degree from Arizona State University. He taught high school chemistry and physics, including regular, honors and
AP courses, in Michigan and Arizona for 34 years. He was a Woodrow Wilson Dreyfus Fellow in Chemistry in
1986 and a Presidential Awardee for Excellence in Science Teaching in 2000. Since 1995, he has conducted
numerous summer workshops for physics and chemistry teachers as part of the Modeling Instruction Program at
ASU, and later in Pennsylvania, N Carolina, Tennessee, New York City, Missouri, California and Colorado. He has
made presentations about and conducted workshops on Modeling Instruction at NSTA, ChemEd and BCCE
conferences. He is a lead contributor to the curricular materials used in Modeling Instruction in chemistry.

Earl Barrett received his B.S. in Science from Seton Hall University and his MST from Antioch College. He taught
high school earth science, biology, chemistry and physics, including regular, honors, dual enrollment and AP
courses, in New Jersey and Arizona for 41 years. He has participated in National Science Foundation graduate
study institutes in mathematics, earth science, and physics at Rutgers University, Newark College of Engineering,
NC State, UC Berkeley, ASU, Florida State, Colorado State, Dartmouth College, Dickinson College and Lewis and
Clark College. He served two years as the president of the Phoenix Union High School District classroom teachers
association and treasurer of the Arizona Science Teachers Association. He was a nominee for Teacher of the Year in
1987, received a Presidential Award for Excellence in Science Teaching in 1993, and was a recipient of the Tandy
Technology Outstanding Teacher Award as a Top Fifty Physics teacher in 1990. Since retiring he has given local
presentations concerning the crisis in physics education and had a related paper published in The Physics Teacher.

Together they taught physics and chemistry at Dobson High School in Mesa, AZ for 20 years.
